

CIE406 Project 1

VLANS

Alaa Hesham | 201500638

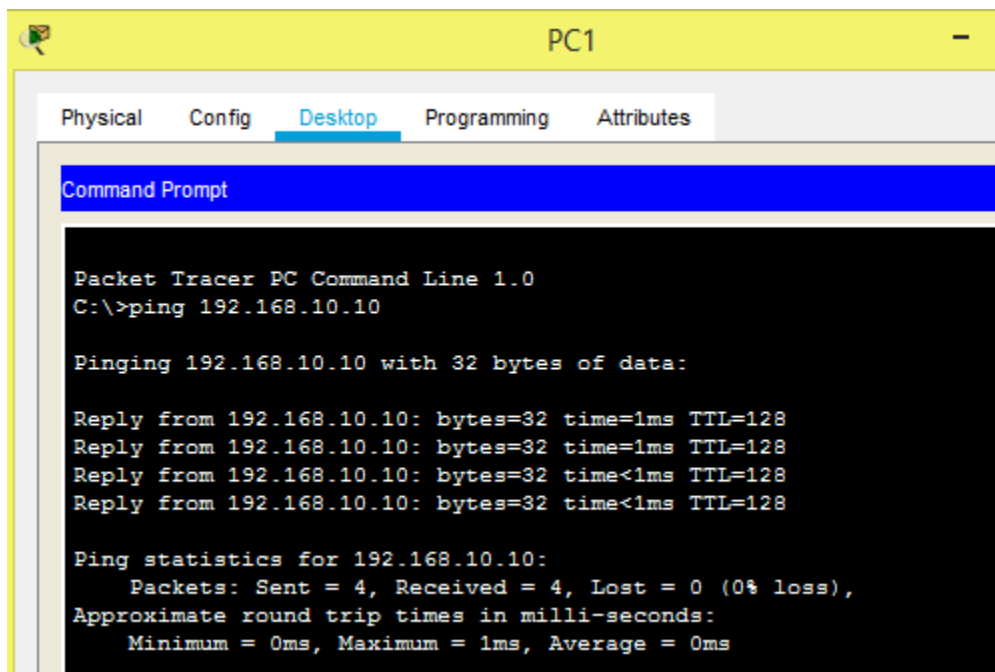

Q1.WHAT BENEFIT WILL BE CONFIGURING VLANS PROVIDE TO THE CURRENT CONFIGURATION?

- improved security
- more management efficiency

Step 1: Verify connectivity between PCs on the same network

- 1) Can PC₁ ping PC₂?
- 2) Can PC₃ ping PC₄?
- 3) Can PC₀ ping PC₅?

PC₁ pings PC₂

The screenshot shows a Packet Tracer PC window for PC1. The 'Desktop' tab is selected, displaying a Command Prompt. The command prompt shows the execution of a ping command to 192.168.10.10, which is successful. The output includes the command line, the ping command, the data size, the number of replies, and the ping statistics.

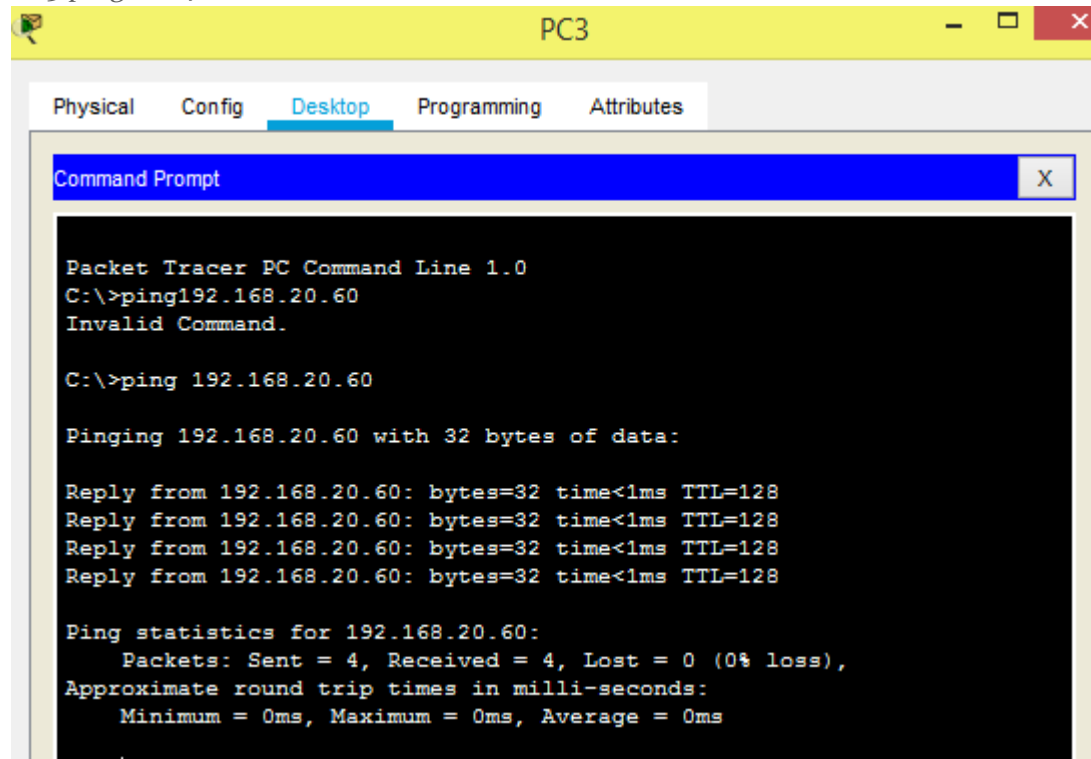

```
Packet Tracer PC Command Line 1.0
C:\>ping 192.168.10.10

Pinging 192.168.10.10 with 32 bytes of data:

Reply from 192.168.10.10: bytes=32 time=1ms TTL=128
Reply from 192.168.10.10: bytes=32 time=1ms TTL=128
Reply from 192.168.10.10: bytes=32 time<1ms TTL=128
Reply from 192.168.10.10: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.10.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms
```

PC3 pings PC4

The screenshot shows the Packet Tracer PC configuration window for PC3. The 'Desktop' tab is selected, and a 'Command Prompt' window is open. The command prompt displays the following text:

```
Packet Tracer PC Command Line 1.0
C:\>ping192.168.20.60
Invalid Command.

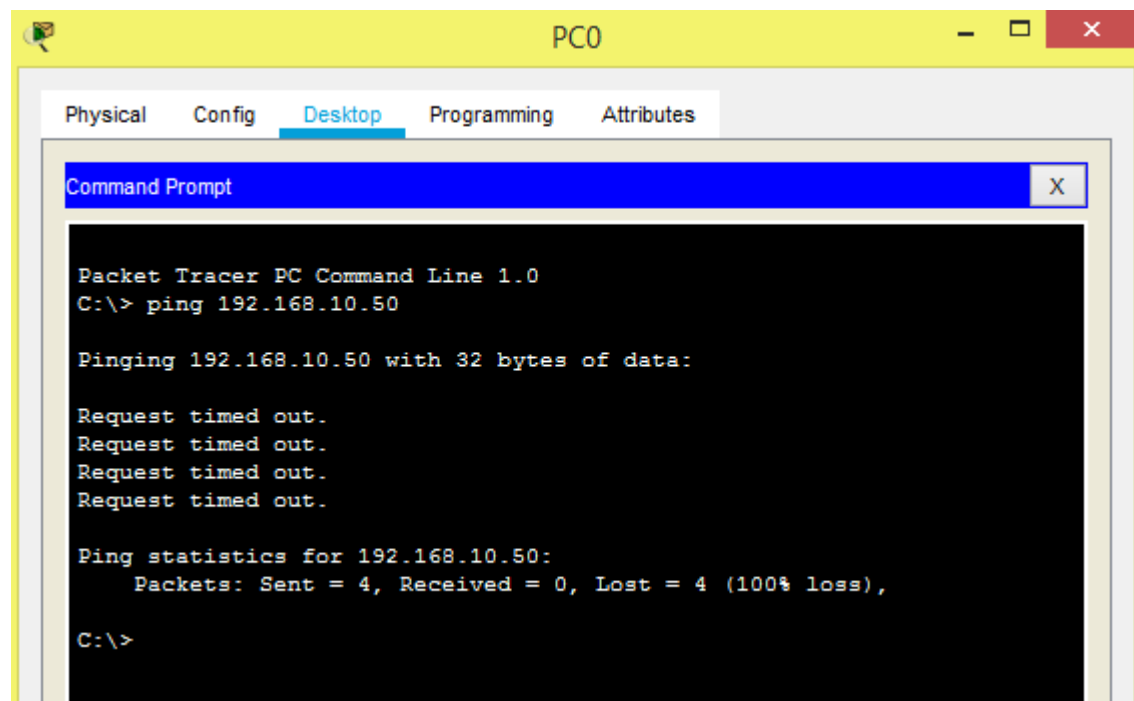

C:\>ping 192.168.20.60

Pinging 192.168.20.60 with 32 bytes of data:

Reply from 192.168.20.60: bytes=32 time<1ms TTL=128
Reply from 192.168.20.60: bytes=32 time<1ms TTL=128
Reply from 192.168.20.60: bytes=32 time<1ms TTL=128
Reply from 192.168.20.60: bytes=32 time<1ms TTL=128

Ping statistics for 192.168.20.60:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 0ms, Average = 0ms
```

PC0 CAN NOT ping PC5

The screenshot shows the Packet Tracer PC configuration window for PC0. The 'Desktop' tab is selected, and a 'Command Prompt' window is open. The command prompt displays the following text:

```
Packet Tracer PC Command Line 1.0
C:\> ping 192.168.10.50

Pinging 192.168.10.50 with 32 bytes of data:

Request timed out.
Request timed out.
Request timed out.
Request timed out.

Ping statistics for 192.168.10.50:
    Packets: Sent = 4, Received = 0, Lost = 4 (100% loss),

C:\>
```

They do not belong to same subnet .

Q2: WHICH COMMAND WILL ONLY DISPLAY THE VLAN NAME, STATUS, AND ASSOCIATED PORTS ON A SWITCH

S1?

show vlan

```
10    Faculty/Staff          active
20    Students               active
99    Management             active
1002  fddi-default           active
1003  token-ring-default     active
1004  fddinet-default        active
1005  trnet-default          active
```

Q3. WHICH COMMAND WILL ONLY DISPLAY THE VLAN NAME, STATUS, AND ASSOCIATED PORTS ON A SWITCHES

So AND S1?

show vlan

```
10    Faculty/Staff          active
20    Students               active
1002  fddi-default           active
1003  token-ring-default     active
1004  fddinet-default        active
1005  trnet-default          active
```

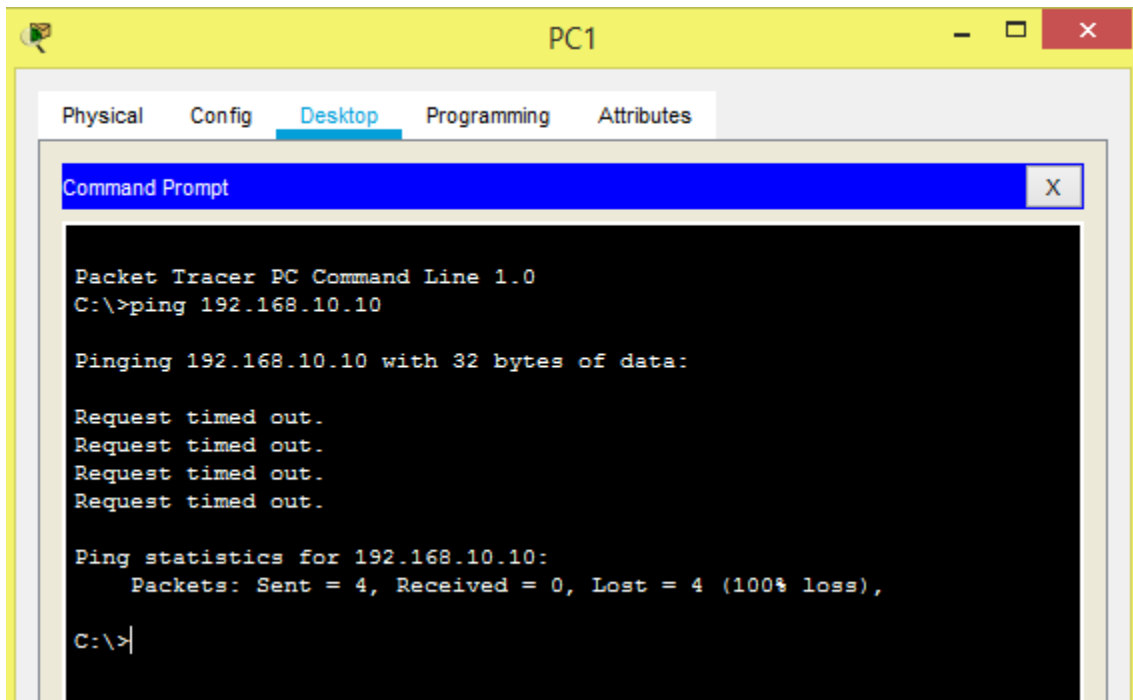

ASSIGNING VLAN TO PORTS

```
10    Faculty/Staff          active    Fa0/1
20    Students               active    Fa0/2
```

VERIFY LOSS OF CONNECTIVITY

Q4. ARE THE PINGS SUCCESSFUL? WHY?

No, the pings are not successful.

Q5. WHAT COULD BE DONE TO RESOLVE THIS ISSUE?

The problem could be solved with the help of trunks.

PART 5 CONFIGURE TRUNKS

```
Switch#show interface trunk
Port      Mode      Encapsulation  Status      Native vlan
Gig0/1    on        802.1q         trunking    1
Gig0/2    on        802.1q         trunking    1

Port      Vlans allowed on trunk
Gig0/1    1-99
Gig0/2    1-99

Port      Vlans allowed and active in management domain
Gig0/1    1,10,20,99
Gig0/2    1,10,20,99

Port      Vlans in spanning tree forwarding state and not pruned
Gig0/1    1,10,20,99
Gig0/2    1,10,20,99

Switch#
```

| | | | | |
|------|--------------------|--------|----------------|--|
| 10 | Faculty/Staff | active | Fa0/20, Fa0/24 | |
| 20 | Students | active | Fa0/1 | |
| 99 | native | active | Fa0/2 | |
| 1002 | fddi-default | active | | |
| 1003 | token-ring-default | active | | |
| 1004 | fddinet-default | active | | |
| 1005 | trnet-default | active | | |

| VLAN | Type | SAID | MTU | Parent | RingNo | BridgeNo | Stp | BrdgMode |
|----------|--------|--------|------|--------|--------|----------|-----|----------|
| Trans1 | Trans2 | | | | | | | |
| 1 | enet | 100001 | 1500 | - | - | - | - | 0 |
| 0 | | | | | | | | |
| 10 | enet | 100010 | 1500 | - | - | - | - | 0 |
| 0 | | | | | | | | |
| 20 | enet | 100020 | 1500 | - | - | - | - | 0 |
| 0 | | | | | | | | |
| --More-- | | | | | | | | |

Q6. PINGS BETWEEN PCS ON THE SAME VLAN ARE NOW SUCCESSFUL. WHY?

Now, it works because of the trunk link we have just configured. As trunk links carry traffic for all the VLANs that are accessible by a specific switch.

```
C:\>ping 192.168.10.10

Pinging 192.168.10.10 with 32 bytes of data:

Reply from 192.168.10.10: bytes=32 time<1ms TTL=128
Reply from 192.168.10.10: bytes=32 time<1ms TTL=128
Reply from 192.168.10.10: bytes=32 time<1ms TTL=128
Reply from 192.168.10.10: bytes=32 time=1ms TTL=128

Ping statistics for 192.168.10.10:
    Packets: Sent = 4, Received = 4, Lost = 0 (0% loss),
    Approximate round trip times in milli-seconds:
        Minimum = 0ms, Maximum = 1ms, Average = 0ms
```

Q7. VERIFY TRUNKING IS ENABLED ON S0 AND S2

On S0, Gig 0/1 is automatically set to trunk as S1's Gig 0/1 is set to trunk.

```

Switch>show interface trunk
Port      Mode           Encapsulation  Status        Native vlan
Gig0/1    auto           n-802.1q       trunking      1

Port      Vlans allowed on trunk
Gig0/1    1-1005

Port      Vlans allowed and active in management domain
Gig0/1    1,10,20

Port      Vlans in spanning tree forwarding state and not pruned
Gig0/1    10,20

```

On S2, Gig o/2 is automatically set to trunk as S1's Gig o/2 is set to trunk .

```

Switch>show interface trunk
Port      Mode           Encapsulation  Status        Native vlan
Gig0/1    auto           n-802.1q       trunking      1

Port      Vlans allowed on trunk
Gig0/1    1-1005

Port      Vlans allowed and active in management domain
Gig0/1    1,10,20

Port      Vlans in spanning tree forwarding state and not pruned
Gig0/1    10,20

```

Q8. WHICH ACTIVE VLANS ARE ALLOWED TO ACROSS THE TRUNK?

I have made them from vlan 1-99 through this command

switchport trunk allowed vlan 1-9

Q9. CORRECT THE NATIVE VLAN MISMATCH ON S0 AND S2

ON SWITCH 2 , the same is with switch 0

```
Switch>show interfaces G0/2 switchport
Name: Gig0/2
Switchport: Enabled
Administrative Mode: dynamic auto
Operational Mode: trunk
Administrative Trunking Encapsulation: dot1q
Operational Trunking Encapsulation: dot1q
Negotiation of Trunking: On
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 1 (default)
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Operational private-vlan: none
Trunking VLANs Enabled: All
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
Capture VLANs Allowed: ALL
Protected: false
```

Q10 .WHY IS PORT G0/1 ON S2 NO LONGER ASSIGNED TO VLAN 1?

// EDIT PORT G0/2

To Correct the native VLAN mismatch on S0 and S2, I have run the following commands

```
-enable
-conf t
-vlan 99 ( 99 is example of your wanted vlan number )
-name native
-exit
-conf t
```

-int + Go/2 (e.g fao/1)

-switchport trunk native vlan 99

NOW

| | | | |
|--|--------------------|--------|-----------------------------------|
| 1 | default | active | Fa0/3, Fa0/4, Fa0/5, Fa0/6 |
| | | | Fa0/7, Fa0/8, Fa0/9, Fa0/10 |
| | | | Fa0/11, Fa0/12, Fa0/13, Fa0/14 |
| | | | Fa0/15, Fa0/16, Fa0/17, Fa0/18 |
| | | | Fa0/19, Fa0/20, Fa0/21, Fa0/22 |
| | | | Fa0/23, Fa0/24, Gig0/1 |
| 10 | Faculty/Staff | active | Fa0/1 |
| 20 | Students | active | Fa0/2 |
| 99 | native | active | |
| 1002 | fddi-default | active | |
| 1003 | token-ring-default | active | |
| 1004 | fddinet-default | active | |
| 1005 | trnet-default | active | |
| VLAN Type SAID MTU Parent RingNo BridgeNo Stp BrdgMode | | | |
| Trans1 Trans2 | | | |
| ----- | | | |
| ----- | | | |

By running , “show interfaces Go/2 switchport” to check

- we can see

```
Switchport: Enabled
Administrative Mode: dynamic auto
Operational Mode: trunk
Administrative Trunking Encapsulation: dot1q
Operational Trunking Encapsulation: dot1q
Negotiation of Trunking: On
Access Mode VLAN: 1 (default)
Trunking Native Mode VLAN: 99 (native)
Voice VLAN: none
Administrative private-vlan host-association: none
Administrative private-vlan mapping: none
Administrative private-vlan trunk native VLAN: none
Administrative private-vlan trunk encapsulation: dot1q
Administrative private-vlan trunk normal VLANs: none
Administrative private-vlan trunk private VLANs: none
Operational private-vlan: none
Trunking VLANs Enabled: All
Pruning VLANs Enabled: 2-1001
Capture Mode Disabled
Capture VLANs Allowed: ALL
Protected: false
--More--
```

APPENDIX : PACKET TRACER USED COMMANDS

HOW TO MAKE A CERTAIN SWITCH INTERFACE BELONGS TO CERTAIN VLAN ?

Switch : en (enable)

Show vlan

How to create and name vlan

```
Switch#config t
Enter configuration commands, one per line.  End with CNTL/Z.
Switch(config)#vlan 10
Switch(config-vlan)#name Faculty/Staff
Switch(config-vlan)#vlan 20
Switch(config-vlan)#name Students
Switch(config-vlan)#exit
```

How to make a switch interface belongs to certain vlan ?

```
Switch(config)#interface fastEthernet 0/1
Switch(config-if)#switch
% Incomplete command.
Switch(config-if)#swit
Switch(config-if)#switchport mode
Switch(config-if)#switchport mode acc
Switch(config-if)#switchport mode access
Switch(config-if)#swit
Switch(config-if)#switchport access vlan 10
Switch(config-if)#
```

HOW TO MAKE A LINK TRUNK ?

-enable

- conf t

- int + interface number (e.g. fao/1)

-switchport mode trunk

-switchport trunk allowed vlan 1-99

-end

// for illustration

-show run (to show running configuration)

- show interface trunk

HOW TO MAKE A NATIVE VLAN ?

-enable

-conf t

-vlan 99 (99 is example of your wanted vlan number)

-name native

-exit

-conf t

-int + interface name (e.g fao/1)

-switchport trunk native vlan 90

// to illustrate

- show interfaces Go/2 switch port
